Abstract

Human beings have been creating the planet is human centric, but is not, on the planet every creatures, microbes have there own significant, but unfortunately the planet has morphed into the human centric, if other creatures not there on the planet, the survival system of the humanity put into lurch, if man kind not exist on the planet, other creatures could survive easily, this is the significant of man kind. On the earth planet no other disaster only man kind is the disaster. But the naturality of the planet has been devaluing by the human beings, for their survival, for their deeds, for their enjoyment, started to destroy all the possibilities on the earth planet. So this predicament should stop somewhere, otherwise the survival system of human beings will be fall into trouble. In other words, the economy is becoming more significant rather environment, people are more likely to think about economy rather than environment. Environmental problems only confined to text books, that means academician, and common man only mooting the environmental activities in academic perspectives but there is no practical solutions finding by the policymakers of any country on the planet. This environmental concept has to materialise into the practice. To this we have to officiate the marriage between economy and environment.

Introduction

These days, wherever we go everybody talking about economy, and giving too significance to the economy rather environment, economy has been playing pivotal role in the life of human beings, interestingly our life is joyful and healthful not because of fluctuations of the stock market, growing of GDP, increasing economy of the country, good governance etc. Good economy of the country, good governance programs of the country would improve the quality of the delivering system of government but wouldn't gives thoroughly healthier life to the humanity. So environmental sustainability has been impacting fundamentally to the health system of human beings. Sound environment can produce sound health style, environmental quality, and gradation is humongous task on the functioning of health system of human beings.

Objective of the study as follows:

Firstly, to understand the degrading level of the biodiversity system on the earth planet.

Secondly, to understand the impact of degrading of soil fertility.
